

As a Cost Estimator at Ballast Nedam International Projects, you are responsible for preparing accurate and realistic budgets and estimates for large projects in the fascinating international marine world. You will work closely with engineers, designers, planners, and tender management to convert the right information into estimates.

As an experienced cost estimator, performing cost analyses based on specifications, materials, and labor requirements is no problem for you. Additionally, you will develop detailed cost estimates, including risk management and resource planning, to ensure the accuracy of forecasts and, if necessary, conduct site visits to gather information for the estimation.

As part of the tender team, you provide your colleagues with insights into the estimates and involve project management. Of course, you stay actively informed about trends in the sector and relevant countries/regions and keep an eye on cost factors and market fluctuations.
